MULTI-PHASE PRODUCT PUMP FOR “ON-SITE” TESTING

**ADVANCED
TECHNOLOGY
PROVEN DESIGN**

Young Industries offers a wide range of equipment for customer testing. There are some cases where testing cannot be performed at the test facility in Muncy, PA. We offer several systems that are available for “on-site” testing.

For field testing of our Product Pump System we offer a Model PH206-50 Multi-Phase Product Pump which is connected to our FBD24-6 Filter Bag Dump Station. The Product Pump uses plant compressed air to convey powders through a 2” convey line. The Bag Dump Station offers dust control for the inlet of the system. This Product Pump is our smallest unit and conveys at rates up to 125 cu. ft. per hour. The system is 304S/S in product contact surfaces and uses NEMA 4 controls. The equipment is provided on a common support base with fork-lift channels to make it easy to move.

When needed, we provide the service of an application engineer to assist with the “On-Site” Product Pump Testing. Adaptability and versatility of testing equipment provided by Young Industries.
